Marketing Plan: Embedded Systems Workshop

1. Product Overview

The Embedded Systems Workshop is a beginner-friendly, hands-on workshop (1 to 2 days) where participants design, simulate, and build Arduino projects. They start in Tinkercad, then move to real hardware, and leave with a finished project and a GitHub portfolio piece.

What makes it different:

- Project-based, not lecture-based
- Beginners can start free in a simulator, with no hardware needed on day one
- Every participant ends with a portfolio project

2. Target Audience

Segment	Who they are	What they want
Primary	Engineering and computer science students (years 1-3)	Practical skills their courses don't cover, plus portfolio projects
Secondary	High school students interested in tech	A head start before university
Tertiary	Hobbyists and career switchers	An easy, structured way into electronics

Pain points: theory-heavy classes, fear of breaking hardware, not knowing where to start, and nothing to show employers.

3. Situation Analysis (SWOT)

Strengths	Weaknesses
Hands-on format, low entry barrier, a real project outcome	A new brand with no reviews yet, limited seats

Opportunities	Threats
Growing interest in IoT and robotics, universities lacking practical labs	Free YouTube tutorials, competing workshops and bootcamps

4. Goals (SMART)

- Reach 5,000 people through social media within 4 weeks

- Get 100 registrations and 60 attendees (60% show-up rate)
- Reach a 4.5 / 5 satisfaction score
- Convert 30% of attendees into followers or repeat participants

5. Positioning

For students who want real engineering skills, the Embedded Systems Workshop is a hands-on experience that turns beginners into builders, with a finished project to show for it.

Tagline ideas: "Build it. Code it. Own it." / "From zero to circuit in one day."

6. Marketing Mix (4Ps)

- **Product:** workshop sessions, starter materials, a certificate, and a GitHub template for each project
- **Price:** low-cost or free with registration, with an early-bird discount and a group rate for friends
- **Place:** a university lab or partner venue, plus an online option using Tinkercad
- **Promotion:** short demo videos, campus posters, student groups, and club partnerships (see the channel plan below)

7. Channels and 4-Week Timeline

Week	Focus	Activities
1: Awareness	Build curiosity	Short reels showing a circuit working, posters on campus, an announcement in student groups
2: Interest	Show the value	Free mini-lesson, "build an LED in 2 minutes" clips, a post from past or demo participants
3: Conversion	Drive registrations	Early-bird deadline, a countdown, partnerships with university clubs and professors
4: Final push	Fill the seats	"Last seats" reminders, a WhatsApp or Telegram reminder group, a FAQ post

Main channels: Instagram and TikTok (short demos), LinkedIn (professional angle), WhatsApp or Telegram groups (where students are most active), campus posters with QR codes, and university clubs.

8. Budget

Item	Share
Hardware kits and materials	40%

Item	Share
Design and printing (posters, flyers)	25%
Paid social ads	20%
Venue and refreshments	15%

9. Success Metrics (KPIs)

- Reach, engagement rate, and link clicks
- Registrations compared to the 100 target
- Attendance rate
- Post-workshop survey score
- Follower growth and repeat sign-ups

10. Visual Design Inspirations

Style direction: a clean, tech look with a dark navy background, bright accent colors (electric blue or green, like a PCB), and simple circuit-line graphics. Bold sans-serif fonts for headings.
